

McIntosh

MR 77

FM TUNER

SERVICE INFORMATION

STARTING WITH SERIAL NO. 53Y82

McINTOSH LABORATORY INC. 2 CHAMBERS STREET BINGHAMTON, NEW YORK

MR 77

ELECTRICAL SPECIFICATIONS

SENSITIVITY

2 μ V for better than 35dB quieting. 2.5 μ V IHF usable sensitivity typical.

SIGNAL TO NOISE RATIO

Better than 75dB below 100% modulation.

HARMONIC DISTORTION

Less than 0.2% mono or stereo at 100% modulation 20Hz to 15kHz. Typically less than 0.05% at 1kHz.

FREQUENCY RESPONSE

\pm 1dB 20Hz to 15KHz with standard 75 μ S de-emphasis.

CAPTURE RATIO

Better than 2.5dB IHF.

SPURIOUS REJECTION

Greater than 100dB IHF.

IMAGE REJECTION

Greater than 100dB at 90MHz; greater than 90dB at 105MHz IHF.

STEREO SEPARATION

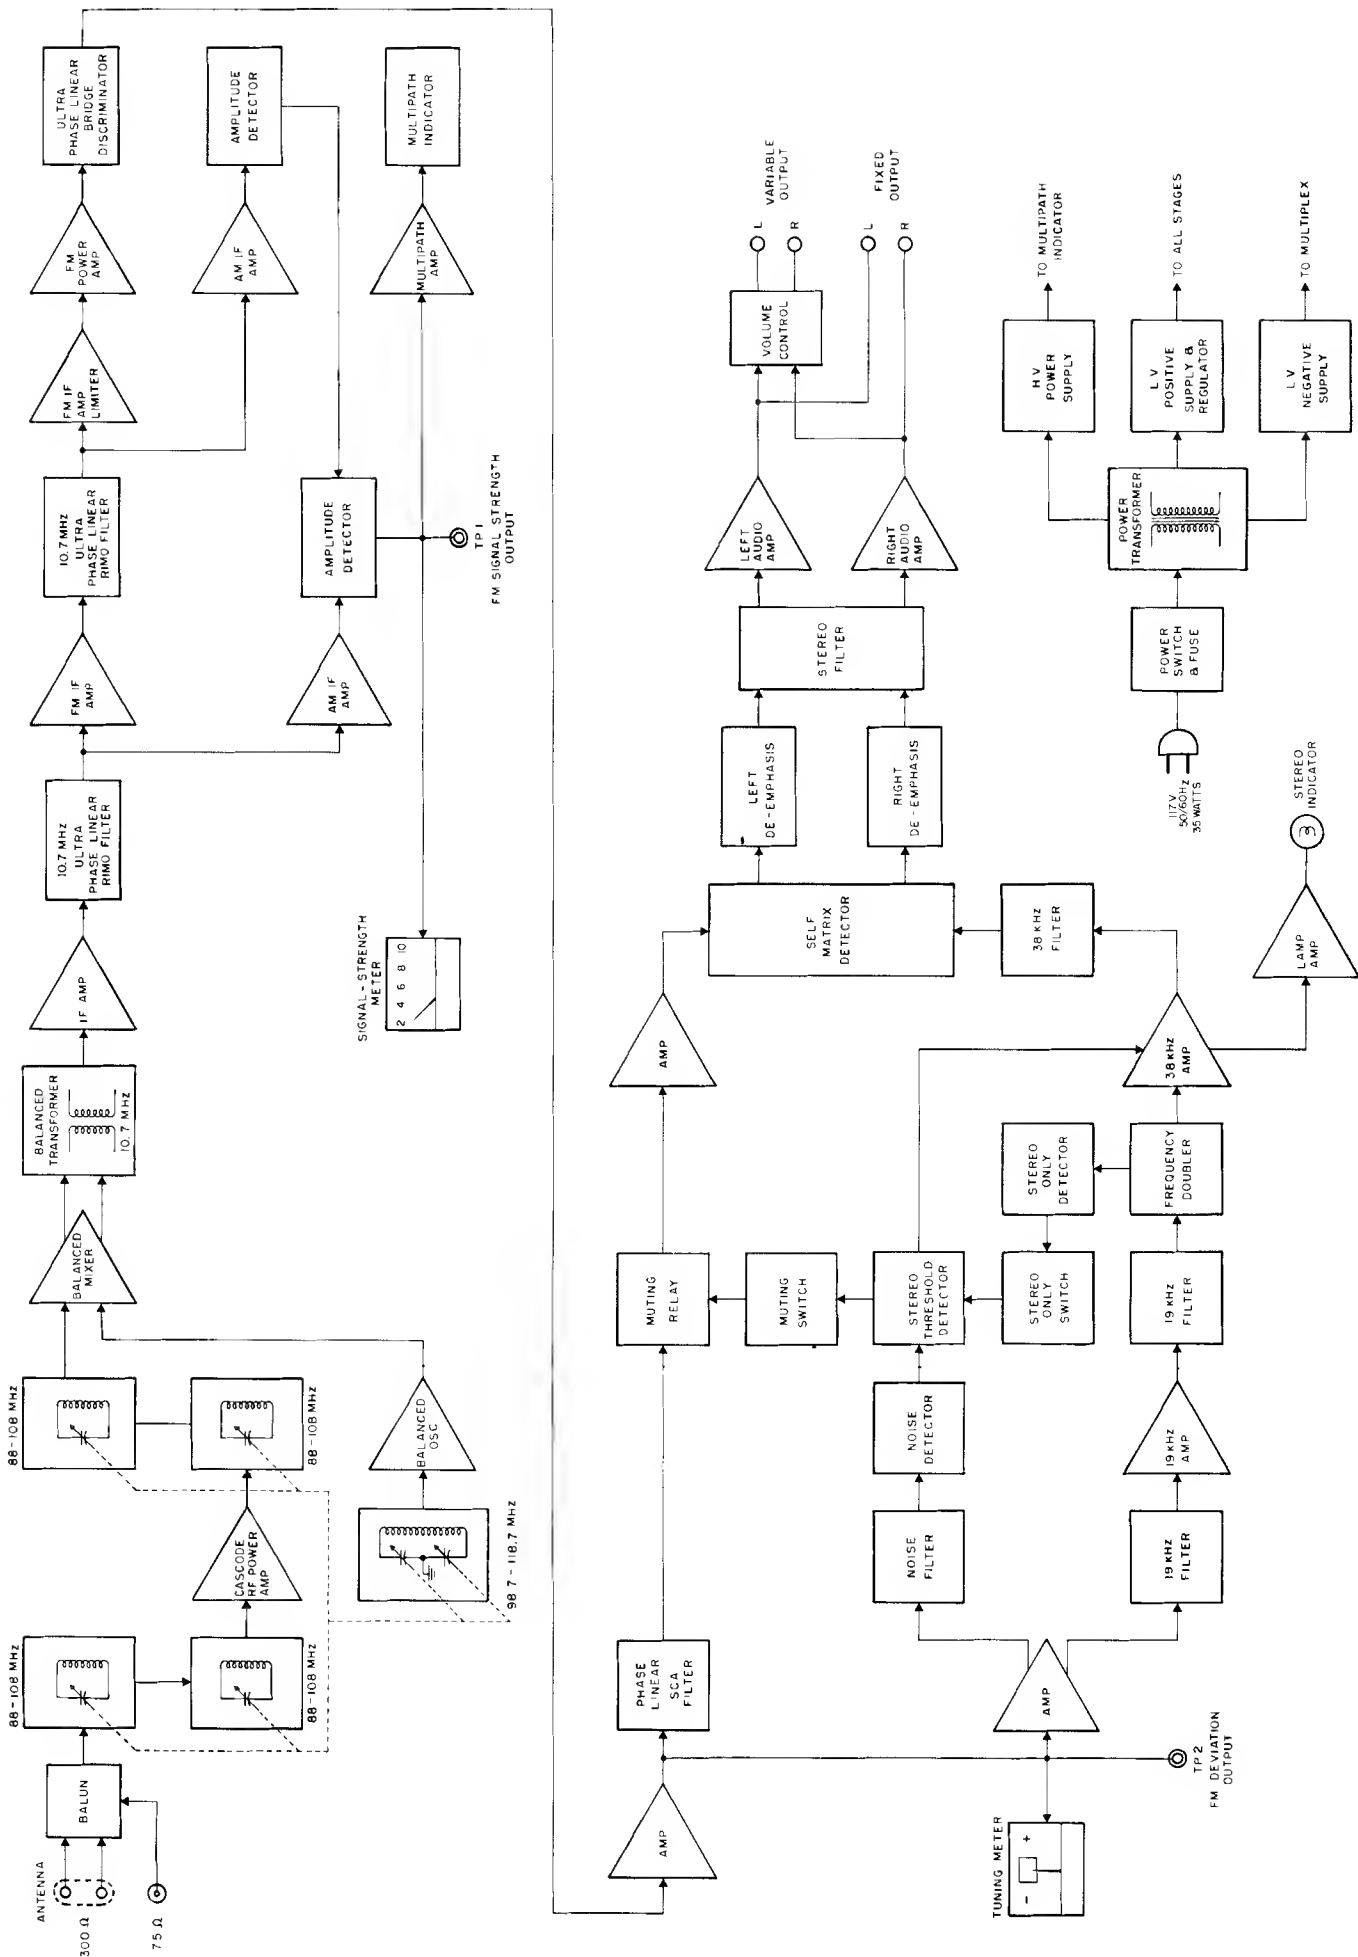

Better than 40dB at 1kHz.

SCA FILTER

50dB down from 67kHz to 74kHz; 275dB per octave slope.

POWER REQUIREMENTS

117VAC, 50 - 60Hz, 35W.

SCHEMATIC NOTES

1. Unless otherwise specified: Resistance values are in ohms, 1/4 watt, and 10% tolerance; capacitance values smaller than 1 are in microfarads (μF); capacitance values greater than 1 are in picofarads (pF); inductors are in microhenries (μH).
2. Printed circuit board components are outlined on the schematics by dotted lines. The circled numbers around the dotted lines correspond to the numbers on the PC Board layouts.
3. The heavy lines on the schematics denote the primary signal path.
4. The terminal numbering of rotary switches is for reference only.
5. All voltages indicated on the schematics are measured under the following conditions:
 - a. Use of an 11 megohm input impedance VTVM.
 - b. All voltages $\pm 10\%$ with respect to chassis ground.
 - c. No signal at input or antenna terminals.
 - d. AC input at 117 volts, 50/60 Hz.
 - e. Front panel controls at:

Tuning Indicator	100MHz (no signal)	Muting	Off
Volume	Fully CW	Mode	Auto
Stereo Filter	Out	Panel Lights	Bright

Tuning Indicator	100MHz (no signal)	Muting	Off
Volume	Fully CW	Mode	Auto
Stereo Filter	Out	Panel Lights	Bright

LAMP & METER REPLACEMENT

To Replace Panel Lights
1. Remove bottom cover.

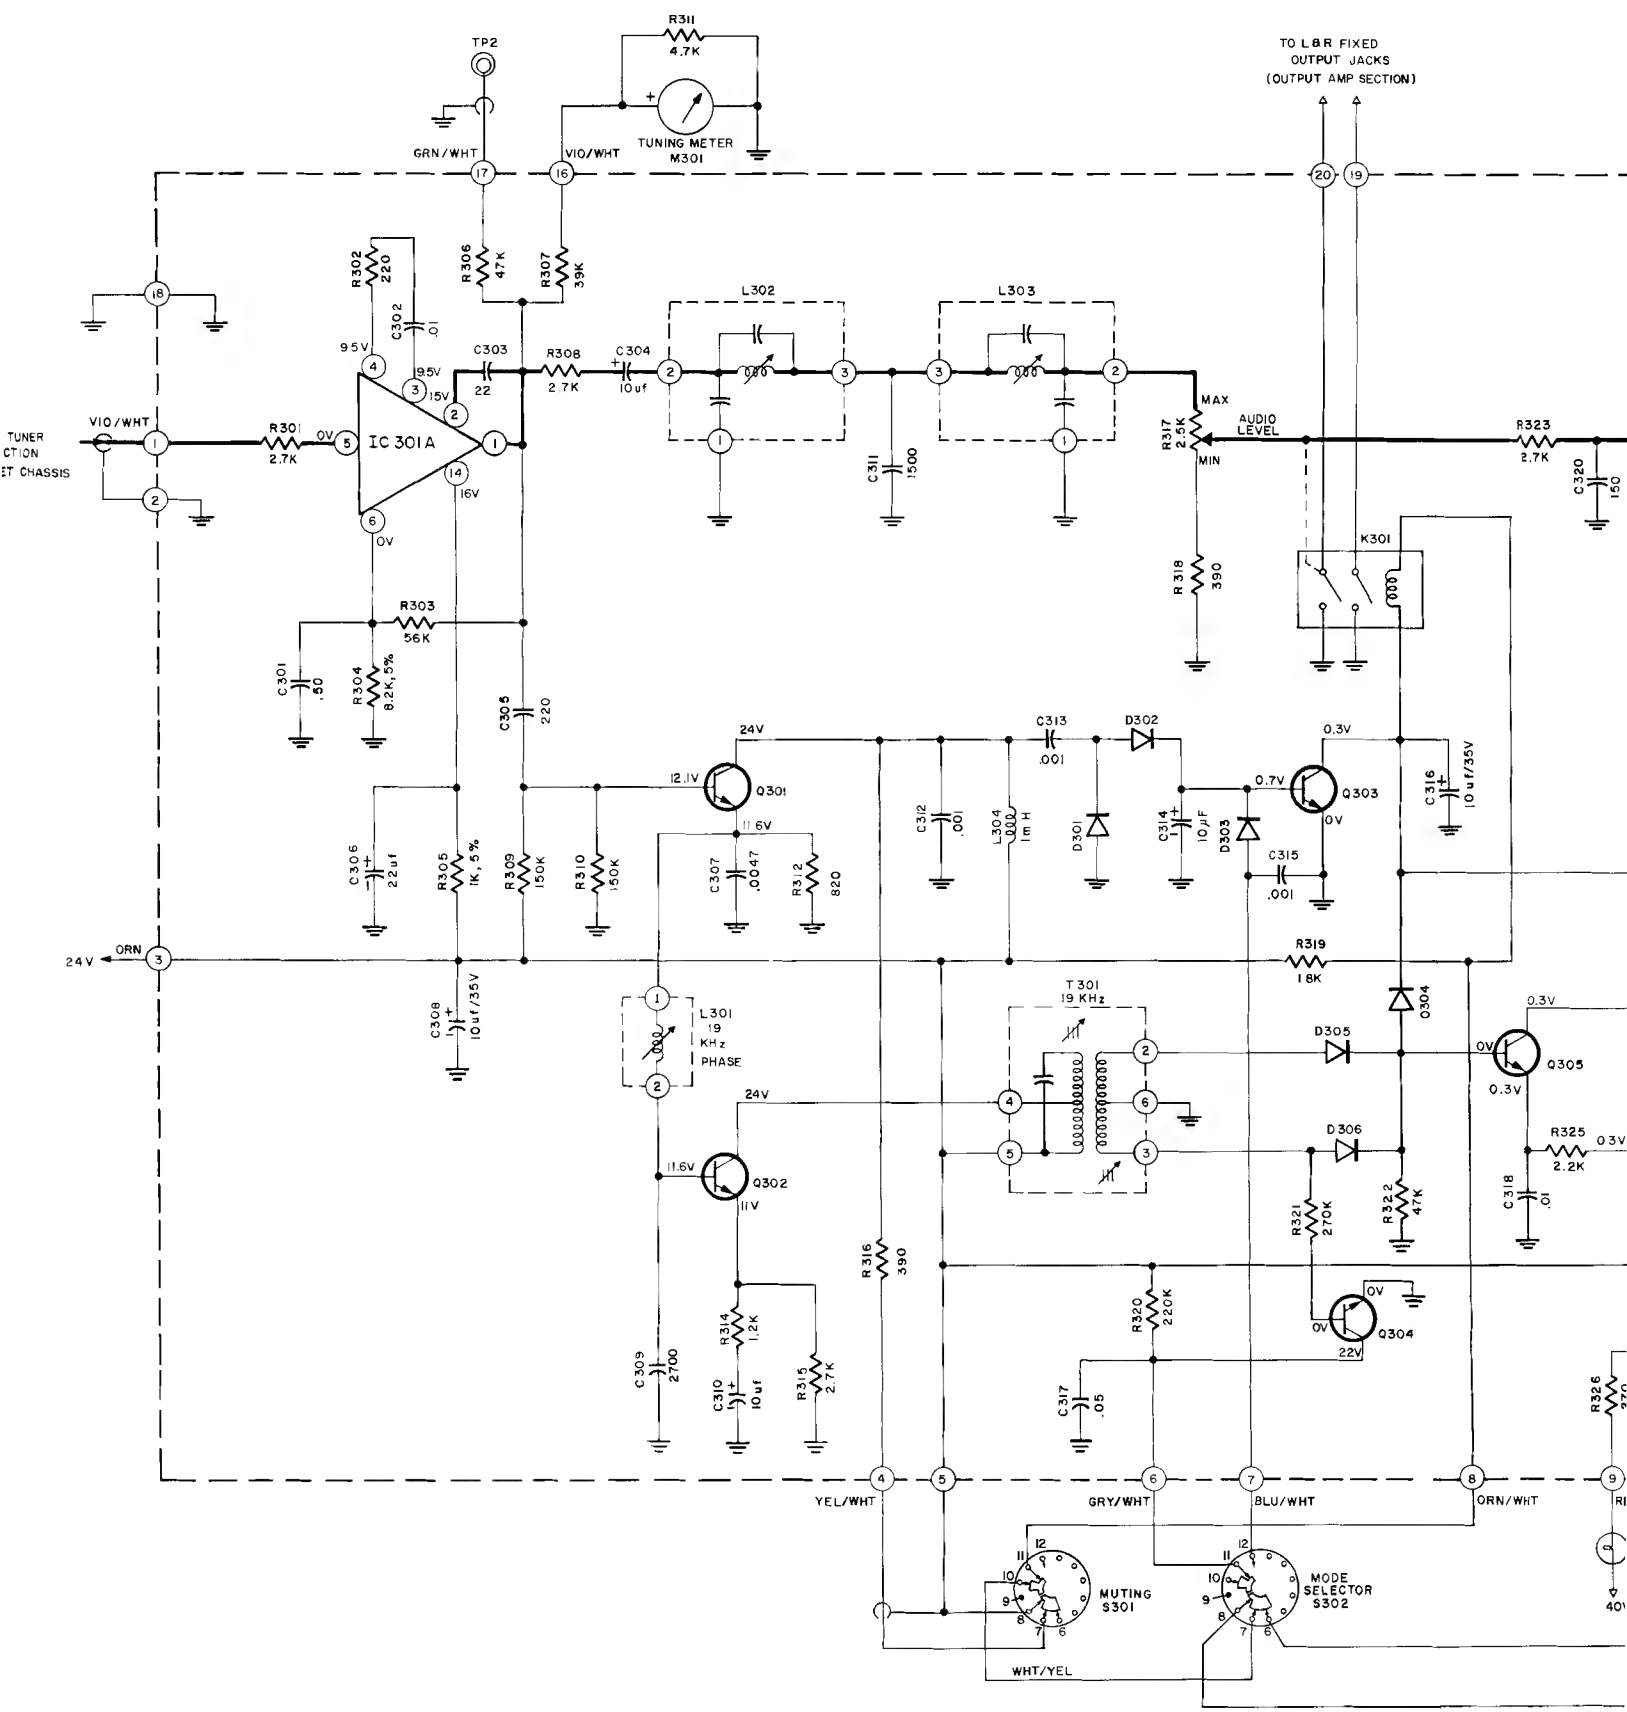

To Replace Dial Panel Lights
1. Remove knobs & front panel.

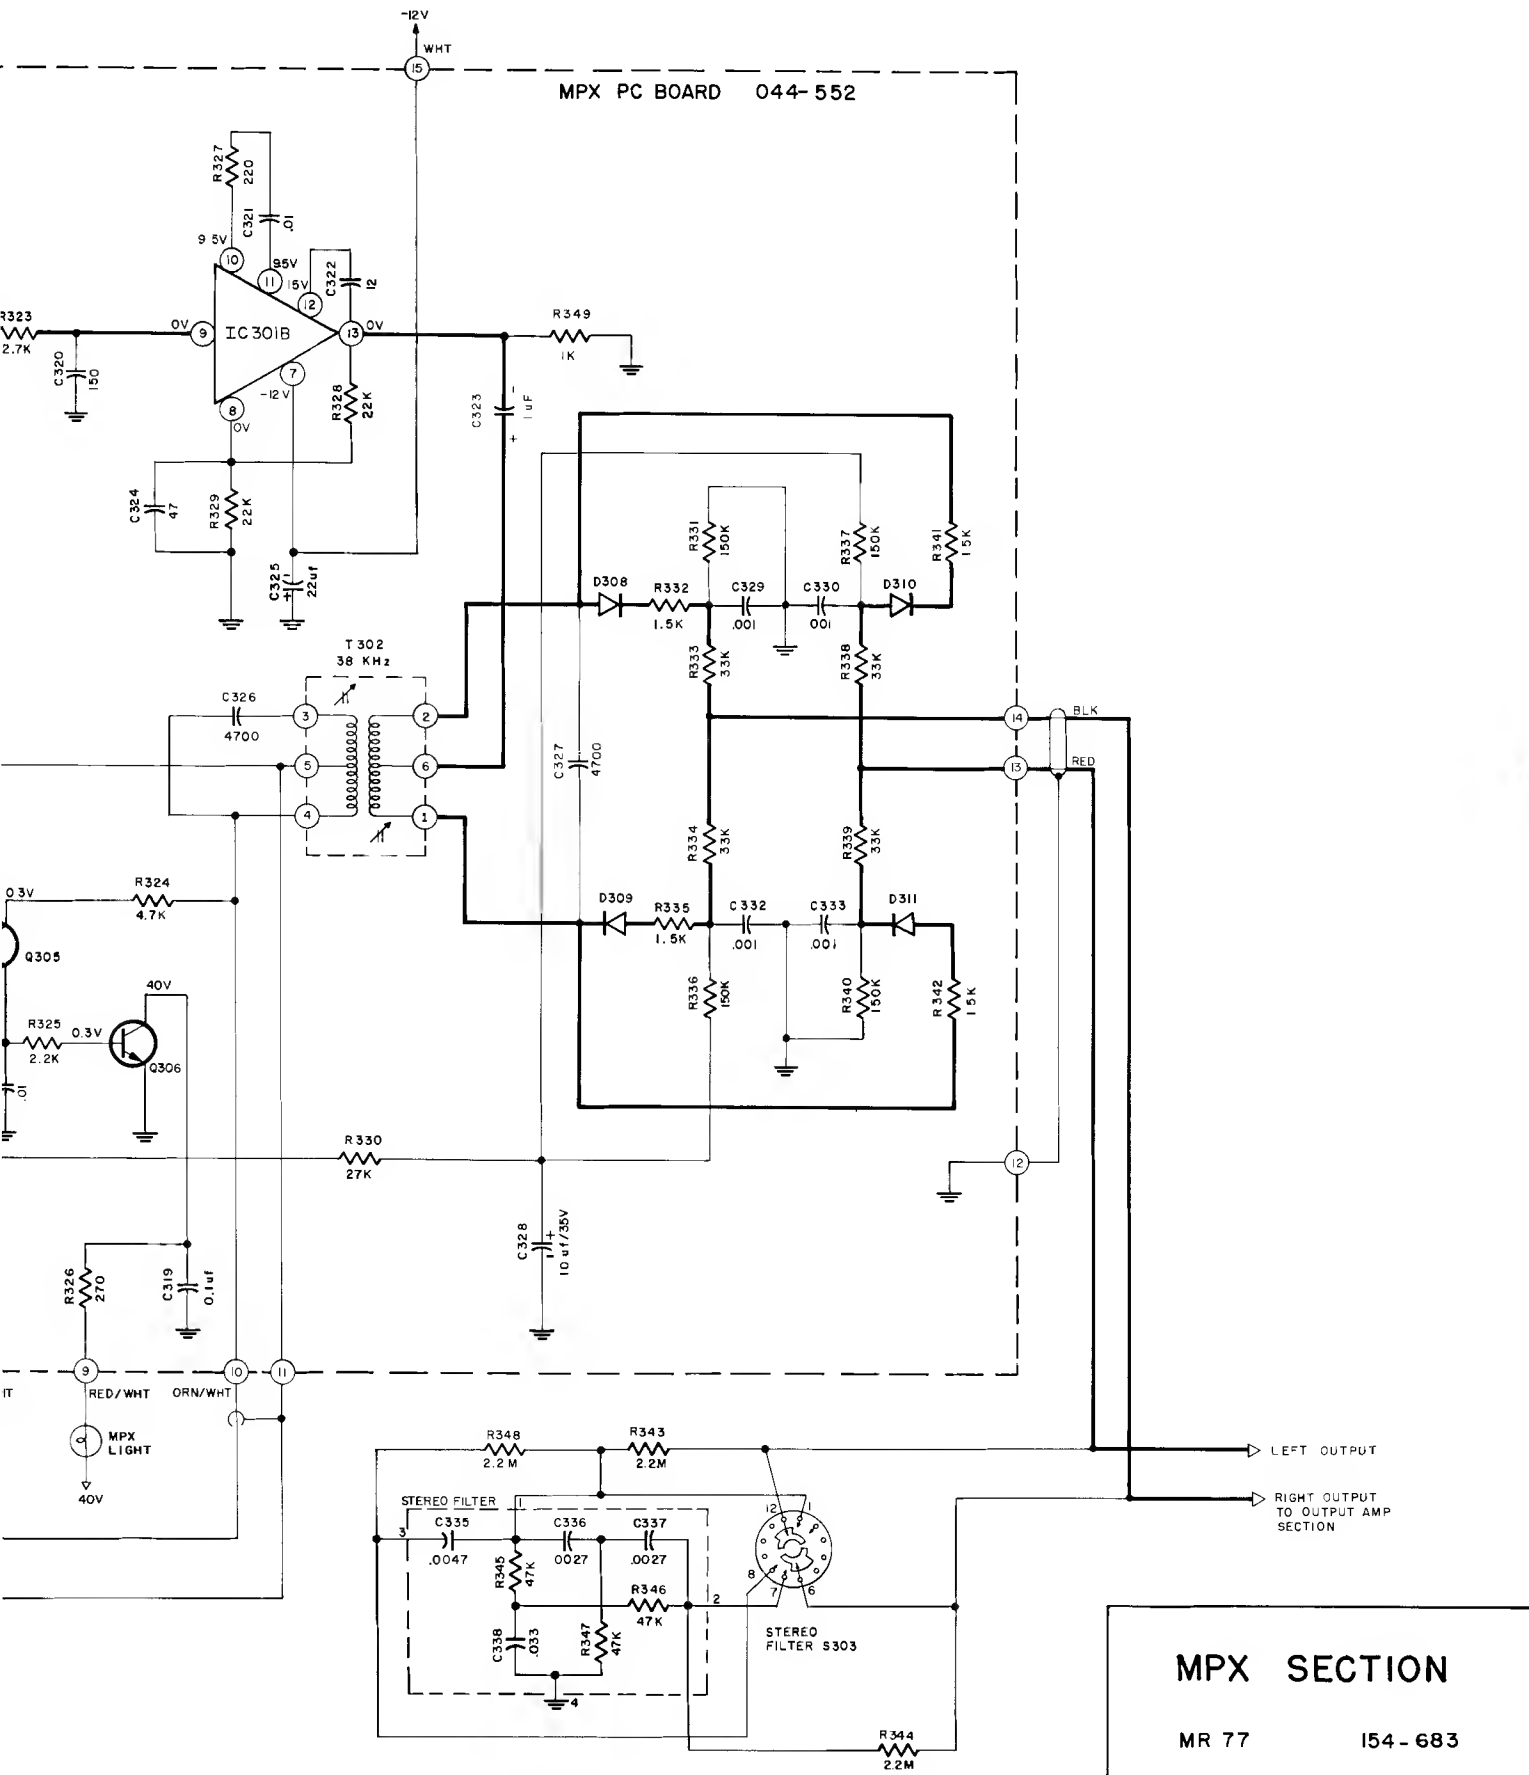

To Replace Stereo Light
1. Remove dust cover.

To Replace Multipath Tube
1. Remove knobs & front panel.
2. Remove dial panel screws.
3. Tilt dial panel forward.
4. Slide out tube.

To Replace Meters
1. Remove knobs & front panel.
2. Remove dial panel screws.
3. Tilt forward dial panel sliding off pointer.
4. Loosen meter screws & remove.

POINTER DRIVE

Step 1 Before stringing unit, turn pointer adjustment screw until pulley "A" is in the center of its travel.

Step 2 String unit as shown.

Step 3 After stringing unit, turn tuning shaft until pointer is as far to the left as it will go. Turn the pointer adjustment screw until the pointer coincides with the zero bar of the logging scale.

Step 4 Turn the tuning knob making the pointer move back and forth from one end of the dial scale to the other. Return pointer to the far left and, if necessary, re-adjust pointer position.

MR77 ALIGNMENT INSTRUCTIONS

TEST EQUIPMENT REQUIRED

All McIntosh tuners are carefully aligned and tested at the factory using the finest available test equipment. All McIntosh tuners will meet their published specifications when shipped from the factory.

After extensive operation, or servicing, it may be desirable to realign the tuner circuits for best performance. The charts below give complete information on the circuit realignment procedure for the MR77.

The test equipment listed (or its equivalent) is necessary to properly align an MR77. The accuracy of the alignment will be directly related to the accuracy and calibration of the test equipment used.

If the necessary test equipment is not available, alignment should not be attempted. For additional information, contact Customer Service Department, McIntosh Laboratory, Inc., 2 Chambers Street, Binghamton, New York 13903 (telephone 607-723-3512).

Alignment should be done in the following order: FM-MPX

1. FM Signal Generator (Measurement 188 or Sound Technology 1000A)
2. VTVM (RCA WV96C)
3. Multiplex Generator (Radiometer SMG1) or Sound Technology 1000A.
4. 10.7 MHz FM sweep generator (Kay 385 or equivalent). (Not needed if Measurement 275 IF converter is available.)
5. 10.7 MHz Generator (preferably crystal controlled)
6. Oscilloscope (Hewlett-Packard 120B or equivalent)
7. Harmonic Distortion Analyzer (Hewlett-Packard 333A or equivalent)
8. 10.7 MHz ± 75 kHz sweep marker generator.

FM ALIGNMENT

STEP	TUNER DIAL SETTING	SIGNAL GENERATOR			INDICATOR		ADJUST	TEST LIMITS	REMARKS
		FREQ.	COUPLING	MODULATION	TYPE	CONNECTED TO			
1	Point of no interference	10.7 MHz	T0 TP-3	FM ± 200 kHz sweep @ 60 Hz rate	Oscilloscope	TP 1	Top (primary) and bottom (secondary) of T2	Maximum height of 10.7 MHz marker and best symmetry of 10.7 MHz ± 75 kHz markers.	Keep signal generator output low to prevent limiting. TP 1 voltage should not exceed 0.5 volts. Rimo filters do not have a flat-topped response. See typical response curve (Fig. 2). If proper response cannot be obtained go to Step 2. Otherwise go to Step 3. Bottom covers must be on front end and discriminator chassis. Regeneration will distort sweep if either cover is removed.
2	Same	Same	Same	Same	Same	Same	Use standard insulated hex tool. Top and bottom cores of Rimo filters accessible thru bottom of circuit board.	Same	Carefully peak each core for maximum gain at 10.7 MHz (center of IF bandpass), and then touch up all cores for best symmetry to obtain bandpass on opposite page. Do not stagger tune.
3	Same	Same	Same	CW	VTVM	TP 2	M301 adjust R210	Zero DC at TP 2	With tuner horizontal and right side up, M301 should be centered. 10.7 MHz frequency must be precise for this adjustment.
4	Same	Same	Same	FM ± 75 kHz @ 60 Hz rate	Oscilloscope	Fixed audio output jacks	Bias pot R203	Maximum audio output	If output is clipped, reduce audio output by adjusting R317; muting off, stereo filter out.

		output jacks		scope		R205		input		adjusting R317; muting ON, stereo filter out.	
STEP	TUNER DIAL SETTING	FREQ.	SIGNAL GENERATOR	MODULATION	INDICATOR	ADJUST	TEST LIMITS	REMARKS			
			COUPLING		TYPE						
5	106 MHz	106 MHz	300 Ω antenna terminals thru matching network or balun	400 Hz; 75 kHz deviation (Fig. 1)	VTVM to TP 1 and scope to L or R audio output	Oscillator trimmer C14	Maximum negative voltage at TP 1	Keep TP 1 voltage below one volt. Observe signal on scope for reference.			
6	90 MHz	90 MHz	Same	Same	Same	Oscillator Coil L6	Same	Same. Repeat Steps 5 and 6 until dial is accurate.			
7	104 MHz	104 MHz	Same	Same	Same	Adjust C3, C4, and C9	Same	Keep TP 1 voltage below one volt. Reduce signal input as circuits align.			
8	92 MHz	92 MHz	Same	Same	Same	L2, L3, L4	Same	Same			
9	104 MHz	104 MHz	Same	Same	Harmonic distortion analyzer to L or R output	C7	Adjust for minimum noise and distortion at 2.5 μ V input	Noise and distortion should be more than 30 dB down. Noise with no modulation should be more than 40 dB down. Touch up C3, C4, and C9 if necessary.			
10	92 MHz	92 MHz	Same	Same	Same	L1	Same	Touch up L2, L3, and L4 only if necessary.			
11	Repeat Steps 9 and 10 until no further improvement is possible. Always adjust for minimum noise and distortion.										
12	92 MHz	92 MHz	Same	1 kHz at ± 75 kHz deviation or Sound Technology dual sweep	Harmonic distortion analyzer to L or R output or Sound Technology to L or R output	R203	Minimum distortion should be less than 0.2%	A very low distortion FM generator is necessary. Sound Technology 1000A is recommended. Typical MR77 distortion is 0.05% in this test. Minimum distortion should correspond closely to maximum audio output. If Sound Technology 1000A is used, adjust R203 for smoothest horizontal dual-sweep pattern. Refer to Sound Technology manual. Check 1 kHz harmonic distortion.			
13	Same	Same	Same	1 kHz at ± 75 kHz deviation	Oscilloscope connected to L or R output	R210		Reduce signal strength until noise appears on tips of signal. If necessary, adjust R210 so that tuning meter is centered.			
14	Same	Same	Same	Same	With muting in distant position, tuner should mute at approximately 5 μ V in 300 Ω . With muting in local position, tuner should mute at approximately 20 μ V in 300 Ω . Muting thresholds are fixed. These values are typical.						

MULTIPLY DECODER ALIGNMENT

STEP	TUNER DIAL SETTING	FREQ.	SIGNAL GENERATOR		INDICATOR		ADJUST	TEST LIMITS	REMARKS
			COUPLING	MODULATION	TYPE	CONNECTED TO			
1	100 MHz or point of no interference	Same as tuner dial	300 Ω antenna terminals with approximately 1000 μ V signal thru matching	Mono (R = L) 1 kHz 100% modulation	Oscilloscope and AC-VTVM connected to either fixed audio output jack.	R317	2.5V RMS at fixed output jacks	Make sure tuning meter is at zero center. Maximum indication on signal strength meter and center indication on tuning meter should coincide.	

STEP	TUNER DIAL SETTING		SIGNAL GENERATOR		INDICATOR		ADJUST	TEST LIMITS	REMARKS
	FREQ.	COUPLING	MODULATION	TYPE	CONNECTED TO				
1	100 MHz or point of no interference	300Ω antenna terminals with approximately 1000μW signal thru matching network or balun	Mono (R = L) 1 kHz 100% modulation	Oscilloscope and AC-VTVM connected to either fixed audio output jack.	R317	2.5V RMS at fixed output jacks	Make sure tuning meter is at zero center. Maximum indication on signal strength meter and center indication on tuning meter should coincide.		
2	Same	Same	67kHz and 53kHz at ±75kHz deviation	Pin 13 of I _c on stereo decoder board	L302 and L303	Adjust L302 for maximum 53kHz, L303 for minimum 67kHz. Do not attempt to detect 67kHz at tuner output jacks. Ground scope probe close to multiplex board. Repeat adjustments of L302 and L303 until optimum condition is reached.			
3	Same	Same	19 kHz pilot	Base of Q305	L301 and T301	For maximum amplitude	Decrease pilot level, if necessary, so that 19 kHz circuits do not limit or saturate.		
4	Same	Same	Same	T302 Pin 1 or 2	T302 top and bottom	Maximum amplitude	Use normal (9%) pilot level. Remove scope probe before going to Step 5.		
5	Same	Same	Stereo 1 kHz (100% modulation) left only pilot level normal and on	Right fixed output jack	T302 bottom (sec) and R4	40dB separation or more	First set R401 to maximum resistance. (Fully clockwise looking from front of tuner.) Adjust T302 bottom tuning slug (sec) for minimum output on right (undesired) channel. Then adjust R401 for maximum separation. Repeat the adjustment of T302 bottom and R401 until maximum separation is obtained. Then reverse channels and measure left channel separation.		
6	Same	Same	Stereo pilot carrier modulation only	L or R output jack		Less than 50MV of residual	With modulation off but pilot on. (NOTE: Stereo generator must have low spurious output.)
