

# TCS4530 REMOTE SC25 TRANSMITTER AND TCS4531 REMOTE SC25 RECEIVER INSTALLATION

RAULAND-BORG CORPORATION • 3450 West Oakton Street, Skokie, Illinois 60076-2951 • (708) 679-0900

## GENERAL INFORMATION

### DESCRIPTION

The Rauland TCS4530 Remote SC25 Transmitter and TCS4531 Receiver Module make it possible to locate SC25 (TC4110) and SCC25 (TC4120) Speaker-Control Assemblies up to 1,000 feet (305 meters) away from the Telecenter® TCS or Telecenter IV central switch; without these modules, the Speaker-Control Assemblies cannot be located more than 15 feet (4.6 meters) away.

The extension is accomplished in two ways. First, the Transmitter lowers the output impedance of the digital control signals to the speaker-control boards; second, the Receiver changes the room call-in signals (made by grounding the "T" terminal directly or via a 1,500Ω resistor) from analog to digital signals, and sends them over four wires directly to the input/output (CIO or MIO) board of the central switch.

Using digital call-in signals results in considerable savings in wiring costs where staff stations are located in clusters away from the central switch. Instead of having to home-run wires from each call-in switch to the central switch, these individual wires need be run only to a local cluster of speaker-control boards. All of the wiring that is needed between this local cluster and the central switch is a 12-twisted-pair 24-AWG cable, such as AT&T's IC-PVC12P24B telephone cable. This is a far cry from the 400 conductors that a group of 100 staff stations would require in a standard configuration.

**Important:** The Transmitter and Receiver handle only control signals. Hence, in addition to the wiring between them, there must be a shielded audio pair (the "S" bus) for each VCM2 Voice-Controlled Module used with the staff stations and paging speakers. The shielded pairs should be of a heavier gauge (depending upon the number of stations at the remote location) to minimize audio-power loss during paging.

### NUMBER OF UNITS

Each Receiver can serve any number of speaker-control modules (up to the system limit), and each Transmitter can serve up to three Receivers. However, the 1,000-foot limitation is the total length of cable for *all* of the Receivers connected to the *same* Transmitter, so whatever length of cable is used for a second Receiver reduces the amount that can be used by the first. Each Transmitter used has a 1,000-foot cabling ability.

### LOCATION

The TCS4530 Transmitter must be located within 15 feet of the central switch. On a Telecenter TCS system, a single Transmitter may be mounted directly on the CIO Board. When there is more than one Transmitter or a Telecenter IV system is used, the Transmitters may be mounted in any convenient place; the supplied plastic feet have adhesive bottoms to simplify mounting (e.g., on the side of a rack).

The TCS4531 Receiver must be located within 15 feet of the speaker-control boards that it serves, and near a standard 120-volt outlet (within the length of its power-supply cord).

### PARTS

#### TCS4530 Transmitter Module

Qty.	Description	Rauland Part No.
1	P.C. Board Assembly	VC7372
1	Cable Clamp	QP0255
4	Standoffs	QP0935
1	26-Pin Connector	SF0426-26
1	#6-32 × 3/8" Pan-head Machine Screw	WA58
1	#6-32 × 1/4" × 3/32" Hex Nut	WB506
1	Four-Pin Jumper Assembly	VW2191

#### TCS4531 Receiver Module

Qty.	Description	Rauland Part No.
1	P.C. Board Assembly	VC7373
1	Cable Clamp	QP0255
4	Standoffs	QP0935
1	Plug-in Power Supply	VP0057
1	#6-32 × 3/8" Pan-head Machine Screw	WA58
1	#6-32 × 1/4" × 3/32" Hex Nut	WB506

### EQUIPMENT DAMAGED IN TRANSIT

These products were carefully inspected and tested at the factory before they were shipped. If your equipment was damaged in transit, notify the transportation company at once to place your claim.

## SPECIFICATIONS

	<b>TCS4530</b>	<b>Size:</b>	4.2" (10.7 cm) wide, 4.8" (12.2 cm) long.
<b>Power Requirement:</b>	12 VDC (provided by the central switch).	<b>Wiring Requirement:</b>	Twelve twisted pairs, 22- or 24-gauge. One shielded pair for audio.
<b>System Limit:</b>	Three modules per system.		
<b>Size:</b>	3.5" (8.9 cm) wide, 4.8" (12.2 cm) long.		
	<b>TCS4531</b>		<b>Associated Equipment:</b>
<b>Power Requirement:</b>	120 VAC, 0.1A.	<b>TCS4501</b>	Central Switch (TCS)
<b>System Limit:</b>	Three modules per TCS4530 Transmitter module.	<b>TC4001</b>	Central Control (TCIV)
		<b>TC4110</b>	Speaker-Control Assembly
		<b>TC4120</b>	Speaker-Control Assembly
		<b>Director™</b>	Series Intercom Systems

## INSTALLATION

The TCS4530 and TCS4531 are designed to mount on PC-board standoffs, which are provided with both units. These standoffs have an adhesive back that permits mounting these units on any flat surface. Space is provided on the CIO board in the Telecenter TCS to mount one TCS4530.

Refer as necessary to the attached wiring diagram, KM0937, for both the TCS4530 and the TCS4531 installations.

### TCS4530 TRANSMITTER

**Step 1.** Make sure that the system power is off.

**Step 2.** Remove the CIO (TCS) or MIO (TCIV) assembly from the central switch.

**Step 3.** Note that the Transmitter PC board has mounting holes. The two adjacent to the 26-pin header are for attaching strain reliefs to the cabling. Working from the foil side of the Transmitter, snap the four supplied adhesive-backed standoff feet (QP0935) into the other four holes.

**Step 4. (a) When installing a single Transmitter on a TCS System:** Orient the Transmitter so that its 26-pin connector is towards the front of the CIO board. Remove the adhesive backing from the standoffs, align them with the four "footprint" outlines near the "CPU" connector on the CIO board, and press the Transmitter into place on top of the CIO board.

**(b) For all other installations:** Find a flat surface near the input/output board, preferably a place within reach of (1) the flat cable that is daisy-chained to the central system's speaker-control boards and (2) the supplied four-pin jumper assembly. Orient the Transmitter so that its 26-pin connector is towards the input/output board, remove the adhesive backing from the standoffs, and press the unit in place.

**Step 5.** If the Transmitter is close enough to the input/output board, plug one end of the four-pin jumper assembly (VW2191) onto the four-pin *J3* header of the Transmitter. Plug the other end onto the "Remote" header

on the input/output board (look at the latter so that its lettering appears right-side up, then find the four-pin header about a quarter of the way from the right side and midway between the top and bottom of the board).

If the jumper assembly does not reach or you are installing more than one Transmitter, make a custom jumper. For two or three Transmitters, use pass-through connectors in the middle, so that you can daisy-chain these connections.

**Step 6.** Plug the input/output board back into the central switch.

**Step 7.** Connect a cable with 12 twisted pairs of 24-AWG (or larger) wire between the Transmitter and each Receiver it is to serve (see the table on the next page). Use either wire-wrapping or a push-on connector to attach the twisted pairs to the 22-pin header (*J1*). If there is more than one Receiver, you can either use wire-wrapping or a mass-termination block at the Transmitter. For wire-wrapping or insulation-piercing connectors, use solid or tinned cabling. Use the supplied cable clamp, screw, and nut to attach the cable to one of the holes near *J2*, for strain relief.

**Important:** The *total* length of cable running between each Transmitter and its Receivers must not exceed 1,000 feet. Thus, if one Receiver is 750 feet away, a second one could not be more than 250 feet away. Contact Rauland's Sales Engineering if it is necessary to exceed this limit.

**Step 8.** If the flat-cable connector that is daisy-chained between the central system's input/output and speaker-control boards will reach the Transmitter, use the supplied 26-pin connector (SF0426-26) to tap into it. Otherwise, you will have to make a new flat cable that will accommodate whatever Transmitters you are installing as well as the standard connections.

**Step 9.** Plug this 26-pin connector to the *J1* header on the TCS4530 module. Make sure that Pin 1 of connector on the input/output board gets connected to Pin 1 of the *J1* header on the Transmitter.

**TCS4531 RECEIVER**

**Step 1.** Locate a flat surface on which to mount the Receiver; if possible, place it within reach of (1) the flat cable that is daisy-chained to the speaker-control modules and (2) a standard 120-VAC outlet.

**Step 2.** Starting from the solder side of the module, insert the four standoff into the mounting holes.

**Step 3.** Peel off the adhesive backing from the feet and press them onto the flat surface.

**Step 4.** Wire the 12-pair cable from the Transmitter to the 22-pin header (J2) on the TCS4531 (see the tables below). Make sure that Pin 1 on this header is wired to Pin 1 of the Transmitter's header.

**Step 5.** If the flat-cable connector that is daisy-chained between the remote speaker-control boards will reach the Receiver, use the supplied 26-pin connector (SF0426-26) to tap into it. Otherwise, you will have to make a new flat cable that will accommodate both the speaker-control boards and the Receiver.

**Step 6.** Plug this 26-pin connector to the J2 ejector header on the Receiver. Make sure that Pin 1 of connector on the input/output board gets connected to Pin 1 of the headers on the speaker-control boards.

**Step 7.** Plug the cord from the power supply into the Receiver's SF1 connector, then plug the power supply into a 120-VAC socket.

**ADJUSTING THE COMPARATOR**

The TCS4531 Receiver has a comparator circuit, for call-in sensing, that is similar that on the input/output boards on the TCS and TCIV systems. Accordingly, the RP1 trim pot on the TCS4531 needs to be adjusted in the same way as the RP2 pot on the input/output board.

*Note:* These adjustments require the use of an administrative display phone.

**Step 1.** Turn the RP1 trim pot on each TCS4531 completely counterclockwise.

**Step 2.** Use the #74 adjustment procedure to set RP2 on the CIO or MIO board—see “Call-in Sensitivity Adjustment” in the TCS *Diagnostics, Troubleshooting, and Drawings* manual (KI-1550) or the TCIV *Troubleshooting* manual (KI-1585).

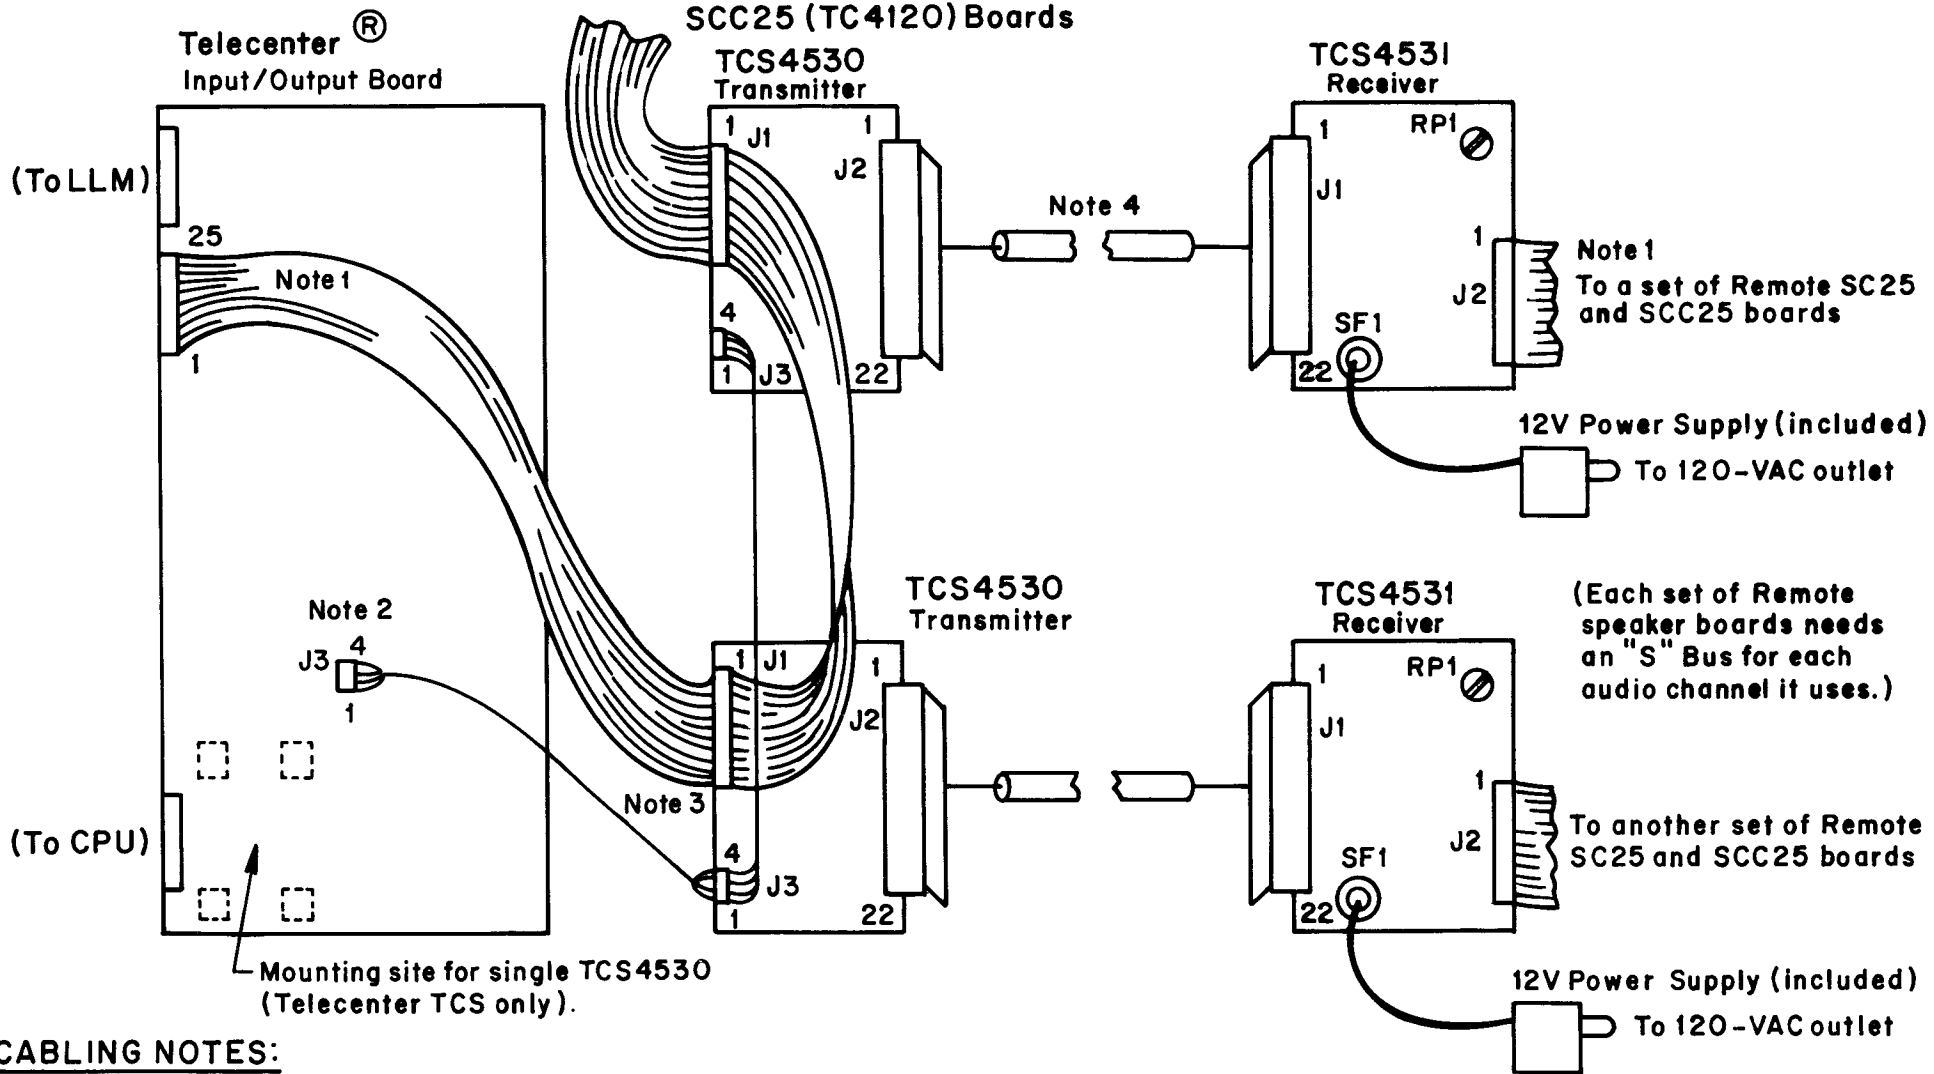

**Step 3.** Adjust the RP1 trim pot on each Receiver, one at a time, by repeating the above procedure, using one of the staff stations that it serves.

**CABLING NOTES:**

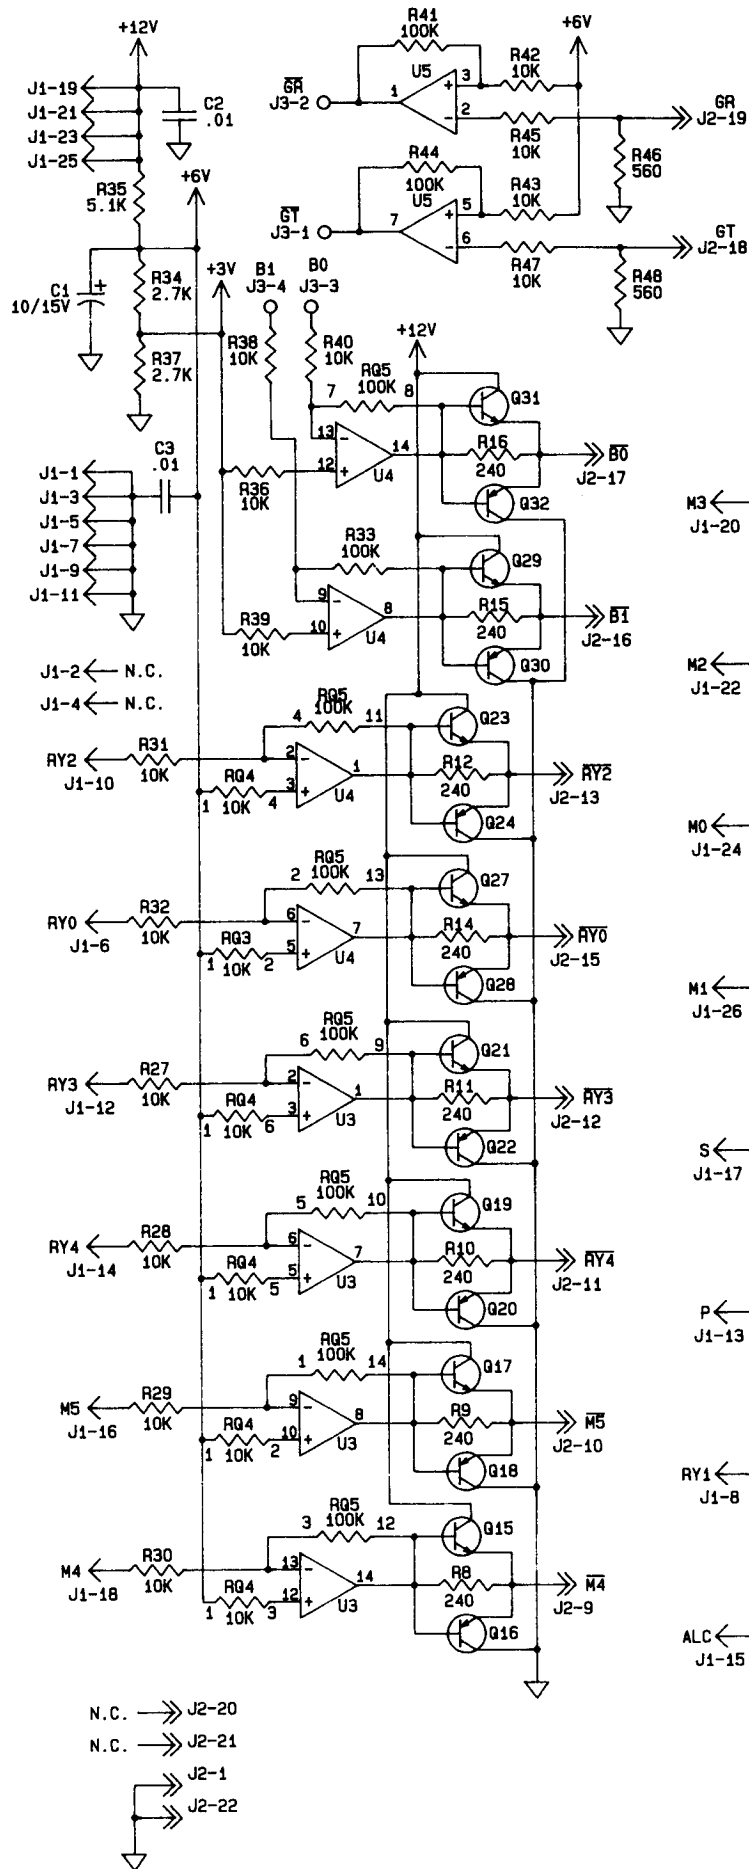

1. Telecenter's 26-wire flat cable or a custom cable up to 15 ft.
2. For input/output boards without J3, contact Sales Engineering.
3. Supplied four-wire harness with customer-furnished pass-through connector (or custom harness).
4. Customer-furnished cable with 11 twisted pairs of 24-AWG conductors (solid or tinned for insulation-piercing connectors or wire-wrapping).

**IMPORTANT:**

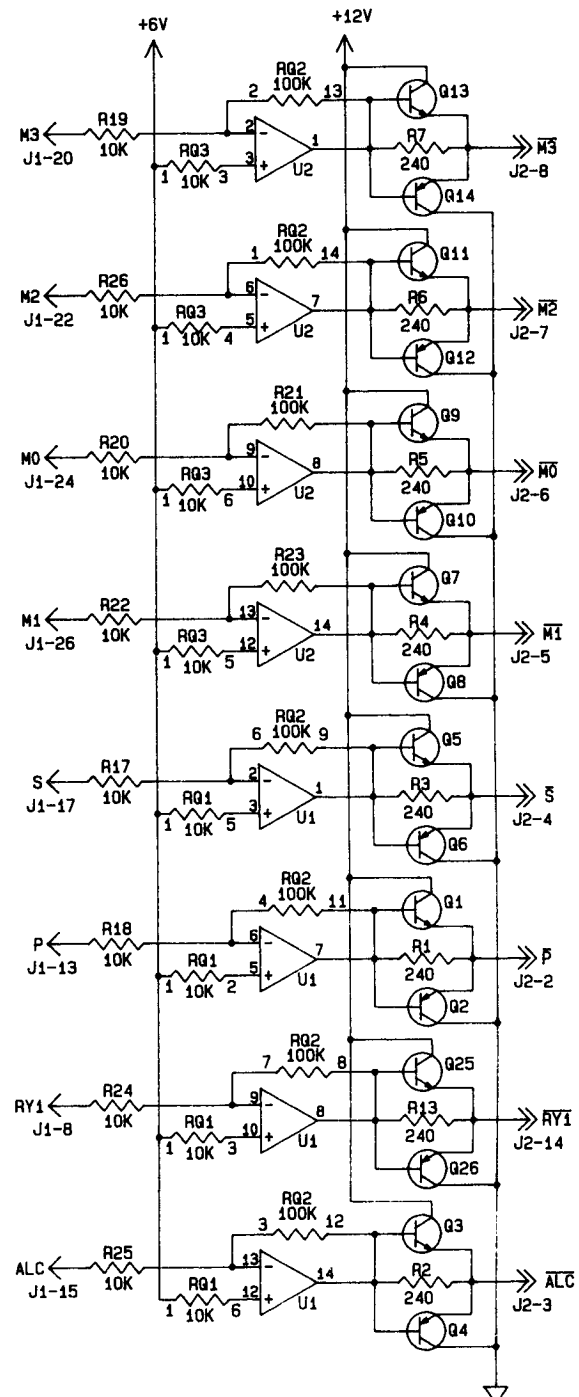

The combined length of all the cables between each Transmitter and all of its Receivers must not exceed 1,000 feet.
