

## Ooops!

I was examining the schematic and PC board in the article "Build an AM Transmitter" (June, 1998), and believe I have uncovered a problem. In the schematic, resistor R45 is shown grounded. However, on the board, it is shown wired to the cathode of D8. Which is correct?

*The PC board is correct. In preparing the art for publication, the connection from the bottom of R45 was drawn too long. It actually terminates at the line above the one shown, which goes to D8 as per the board. We are sorry for any confusion that might have been caused—Editor*
