A.P.I.2520-1

Audio Operational Amplifier

Features

- Extremely low noise
- High output power
- Low quiescent current
- Low distortion
- Operation under a wide range of supply voltages
- Wide power bandwidth
- Standard OP-AMP connections (Plug-in or P.C. mount)
- Stable operating characteristics
- Electrostatically shielded
- Short-Circuit and overload protected
- Applications
- Microphone Preamplifiers
- Line Boosters
- Loudspeaker Combining Amplifiers
- Balanced Transformerless Amplifiers
- Equalizers and Equalized Preamplifiers
- Earphones or Small Speaker Drivers

The Model 2520 is a high gain, wide band, direct coupled amplifier with differential input, designed specifically for audio amplifier applications. Several Operational Amplifier circuits typical of those most often used in the audio field are shown on the following pages, along with their characteristics. These circuits have been tested and the data shown has been validated in Automated Processes laboratories.

For truly perfect performance of the Model 2520 in audio operational amplifier applications, makes possible the design of complete systems utilizing this low cost device as the only active element.

Since Operational Amplifier circuits derive their characteristics almost entirely from the performance of the passive elements connected into the feedback loop, accurate predictions and stable performance can assure the use of this single active plug-in element reduces maintenance and service costs to a minimum.

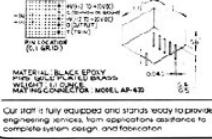

The specially formulated, thermally conductive epoxy in the lead frame and bond wires fully encapsulated protects the printed circuit against thermal shock, vibration and humidity. Conservative design based upon "worst case analysis" plus thorough in-process inspection and performance test after "burn-in" assure long life and reliable performance.

Model 2520
Audio Operational Amplifier

Specifications

- Gain: Greater than 110 dB, DC
- Frequency Response: Small signal Gain Bandwidth Product = 50 mHz Full Output Frequency = 40 kHz
- Equivalent Input Noise: Less than 15 microvolts
- Input Impedance: Greater than 10 megohms, DC
- Input Current Offset: 25 nA Typ., 75 nA Max.
- Input Voltage Offset*: 3mV Typ., 10 mV Max.
- Common Mode Input: ±12 Volts with +15 VDC supply, ±15 Volts with ±20 VDC supply
- Distortion: 0.2% THD, 20 to 20,000 Hz at rated output
- Output Voltage: Greater than 7.75 Volts RMS, ±15 VDC supply; Greater than 11 Volts RMS, ±20 VDC supply
- Minimum Load Impedance: 75Ω for full output voltage
- Continuous Power Output: (Minimum Load Impedance) 0.5 Watts RMS @ ±15 VDC supply, 1.5 Watts RMS @ ±20 VDC supply
- Quiescent Current: 15 Milliamperes @ ±15 VDC supply, 26 Milliamperes @ ±20 VDC supply
- Current of rated Output 400 mW load: 18 Milliamperes @ ±15 VDC supply, 35 Milliamperes @ ±20 VDC supply
- 75Ω Load: 65 Milliamperes @ ±15 VDC supply, 85 Milliamperes @ ±20 VDC supply
- Power Supply Voltage: R-poles: ±12 VDC to ±20 VDC
- *Output offset may be reduced to zero by means of an 10kΩ trim pot between the +V and -V terminals. This is normally not necessary in Audio applications.

Our staff is fully equipped and stands ready to provide engineering services, from applications assistance to complete system design, and fabrication.

Audio Operational Amplifier

API MODEL 2520

FEATURES

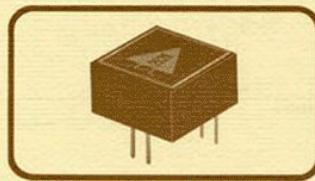

- Extremely low noise
- High output power
- Low quiescent current
- Low distortion
- Operation over a wide range of supply voltages
- Wide power bandwidth
- Standard OP-AMP connections (Plug-in or P.C. mount)
- Stable operating characteristics
- Electrostatically shielded
- Short-Circuit and overload protected

APPLICATIONS

- Microphone Preamplifiers
- Line or Booster Amplifiers
- Lossless Combining Amplifiers
- Balanced Transformerless Amplifiers
- Equalizers and Equalized Preamplifiers
- Earphone or Small Speaker Drivers

GENERAL DESCRIPTION

The Model 2520 is a high gain, wide band, direct coupled amplifier with differential input, designed specifically for audio amplifier applications. Several Operational Amplifier circuits typical of those most often used in the audio field are shown on the fol-

lowing page, along with their characteristics.

Since Operational Amplifier circuits derive their characteristics almost entirely from the performance of the passive elements connected into the feedback loop, accurate, predictable, and stable performance is assured. The use of this single active plug-in element reduces maintenance and service costs to a minimum.

The specially formulated, thermally conductive epoxy in which this 10 discrete transistor amplifier is encapsulated, protects the internal circuitry against thermal shock, vibration and humidity. Conservative design based upon "worst case analysis" plus thorough in-process inspection and performance test after "burn-in" assure long life and reliable performance.

Specifications

All measurements taken at 25°C and with ± 15 VDC supply unless otherwise specified.

- Input Offset Voltage:** 4 mV typ., 10 mV max.
Input Bias Current: 200 nA typ.
Input Offset Current: 25 nA typ., 75 nA max.
Input Resistance: 10 megohms min.
Equivalent Input Noise: 4 nV/ $\sqrt{\text{Hz}}$ typ., 20Hz to 20 kHz
Common Mode Voltage: ± 12 V min.; ± 15 V min. with ± 20 V Supply
Common Mode Rejection: 80dB min.
Open Loop Gain (DC): 200 v/mV typ.
Distortion: .01% T.H.D. typ.; 20Hz to 20kHz at rated output
Slew Rate: 3 V/us typ.
Gain-Band Width Product: 50 mHz typ.
Operating Bandwidth: 40 kHz min. for full output
Output Voltage: ± 11 V min.; ± 15 V min. with ± 20 V supply at rated load

Output Current Limit: 200 mA min.

Minimum Load Impedance: 75 Ω for full output voltage

Continuous Power Output: 1.5 watts RMS (75 load, ± 20 V power supply)

Power Supply Voltage: Bipolar, ± 12 VDC to ± 20 VDC

Quiescent Supply Current: 15 mA typ., ± 15 supply; 26 mA typ., ± 20 V supply

Current at Rated Output: 10 mA, +20 dBm (600 Ω load); 60 mA, +20 dBv (75 Ω load)

Operating Temperature: 0°C to 50°C without derating

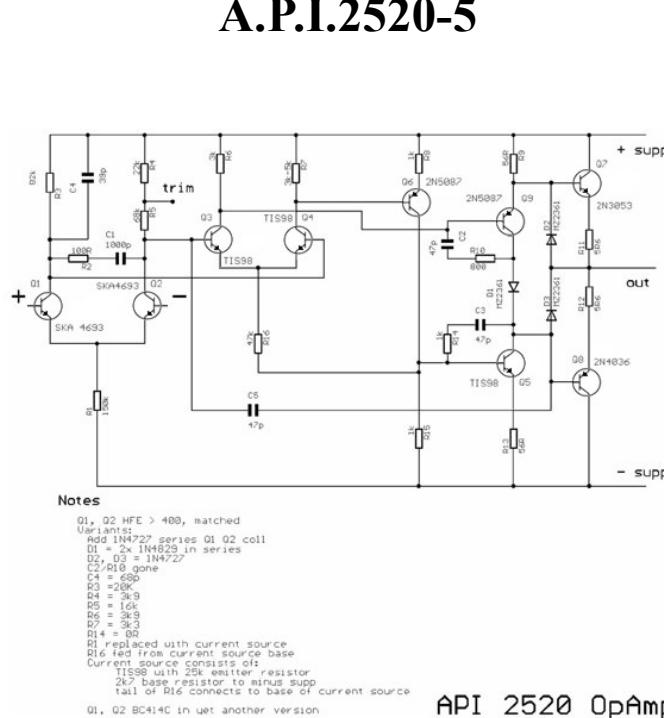

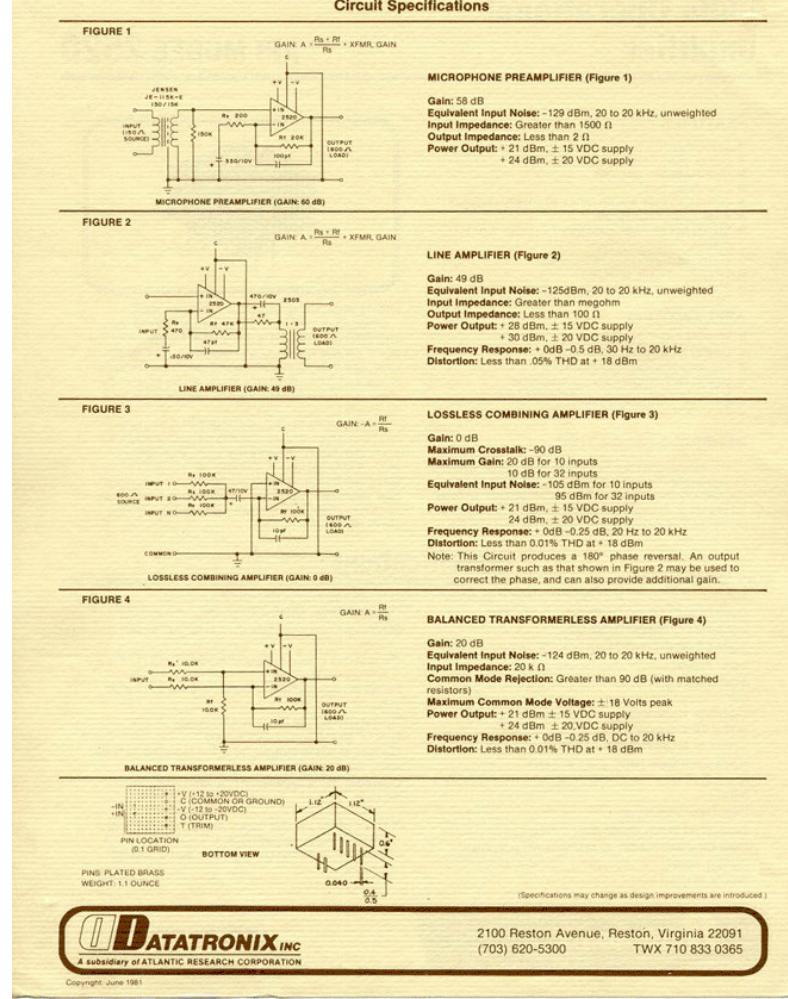

*Output offset may be nulled to zero by means of a 100k Ω trim pot between the \pm V and T terminals. This is normally not necessary in audio applications.

AUTOMATED PROCESSES, INC.

550A (2520X2) & 554 (2520X2)

Model 550A
Equalizer

Equalizer

- Three range—fifteen frequency boost or attenuation in steps to 12 dB
- Shelving or peaking curves independently selectable for upper and lower ranges
- Switchable audio band-pass filter
- Transformer coupled output to +28 dBm
- LED Indicator
- Low noise and distortion
- Panel mounting 1½" X 5¼"
- Utilizes Automated Processes 2520 Op Amps

The Automated Processes® Model 550A Equalizer provides reciprocal equalization at fifteen points in five steps of boost or attenuation to a maximum of 12 dB at each point. The In-Out indicator lamp is a light emitting diode providing almost unlimited indicator life.

The fifteen frequency points are divided into three overlapping ranges with the upper and lower ranges individually selectable as either peaking or shelving. This combination of possibilities makes the 550A ideally suited for all types of music or voice enhancement and effects equalization. A band-pass filter (50 Hz to 15 kHz) may be inserted independent of all other selected equalization settings.

Ten controls are provided to accomplish the various functions. Three dual concentric rotary switches perform frequency selection and degree of equalization for the three ranges. The inner knob selects the desired frequency while the outer knob sets the degree of boost or cut from a mid position (reciprocal equalization) in steps of 2, 4, 6, 9 and 12 dB.

Two push buttons select either the bell-shaped peaking curves or shelving curves for the upper and lower frequency ranges. The five center frequencies in the mid-range are reciprocal bell-shaped peaking families.

A small toggle switch is used to insert the band-pass filter into the equalizer.

A push button throws the equalizer networks in or out of the circuit while lighting a small LED tally light showing when equalization is "In". The switching is silent permitting use of this function during program.

In order to operate signal to noise ratios over the widest possible range of operating conditions, two input/output connections are provided. The "High Level" connection is recommended for input levels between 0 dBm and +12 dBm and provides output capability to +30 dBm. The "Low Level" connection permits operation at levels

Respected Dealers throughout the World.

Model 554
Parametric Equalizer

Parametric Equalizer

- Variable boost and cut to ±15dB
- Bell shaped and notch filter modes
- High and low frequency shelving modes
- Unique input circuitry eliminates ground loops
- Three continuously variable frequency controls
- Silent electronic equalizer In/Out switching

The Model 554 Parametric Equalizer features wide dynamic range continuously variable overlapping non-interactive frequency controls. It provides flexibility and compatibility consistent with the most advanced audio mixing systems.

Precision "state variable" filters are employed to achieve both bell shaped and high "Q" notch filter characteristics.

The 554 provides three overlapping ranges. The upper and lower ranges are provided with selectable shelving modes. Retrofitting into existing consoles is simplified since the unit is the same size as the Automated Processes Model 550A.

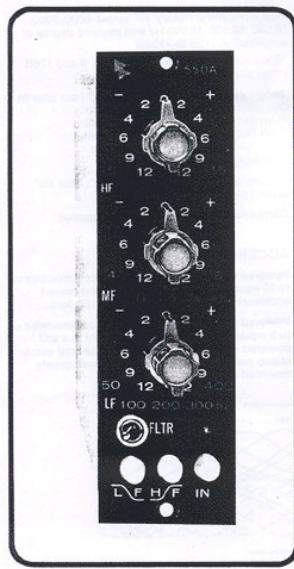

In addition to conventional response curve shaping for tonal effects, the Model 554 is ideal for bandpass, bandstop and notch filtering for the elimination of noise, sibilance, resonance, etc. Non-interactive circuitry provides complete control of the filter when center frequencies are brought close or coincident. Consequently, peaks or notches of as much as 30dB can be achieved. Special effects can also be produced by varying or sweeping the filter frequencies during use.

550A-1 (2520X1) & 550A (2520X2)

Equalizer

API MODEL 550A-1

GENERAL DESCRIPTION

The Automated Processes' Model 550A-1 Equalizer provides reciprocal equalization at fifteen points in five steps of boost or attenuation to a maximum of 12 dB at each point, while maintaining constant Q.

The fifteen frequency points are divided into three overlapping ranges with the upper and lower ranges individually selectable as either peaking or shelving. This combination of possibilities makes the 550A-1 ideally suited for all types of music or voice enhancement and effects equalization. A band-pass filter (50 Hz to 15 kHz) may be inserted independent of all other selected equalization settings.

Three dual concentric rotary switches perform frequency selection and degree of equalization for the three ranges. The inner knob selects the desired frequency and the outer knob sets the degree of boost or cut in steps of 2, 4, 6, 9 and 12 dB.

Two push buttons select either the bell-shaped peaking curves or shelving curves for the upper and lower frequency ranges.

An additional push button silently switches the equalizer network in or out of the circuit while lighting a small LED tally light showing when equalization is active.

In order to optimize signal to noise ratio over the widest possible range of operating conditions, two input/output connections are provided. The "High Level" connection is recommended for input levels between 0dBm and +12 dBm and provides output capability to +30 dBm. The "Low Level" connection permits operation at levels between -15dBm and 0dBm without encountering the usual increase in relative noise level. The maximum output capability in this connection is equivalently reduced to +22dBm.

The Model 550A-1 Equalizer makes use of the API Model 2520 operational amplifier and exhibits the reliability, long life and uniformity which are characteristic of this device.

The Model 550A-1 operates from a bipolar power supply of ±15 to ±18 volts permitting latitude in system design and assurance of stability under normal operating conditions. It is reverse polarity protected and will withstand 150% transients reducing the likelihood of damage from power line surges and power supply malfunctions. Power decoupling is also provided to minimize signal coupling in the power supply lines.

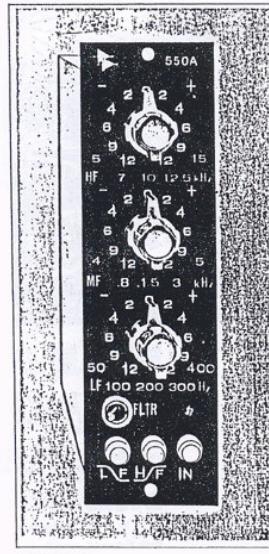

FEATURES

- Three range—fifteen frequency, boost or attenuation in steps to 12dB
- Shelving or peaking curves independently selectable for upper and lower ranges
- Switchable audio band-pass filter
- Balanced differential input
- Transformer coupled output to +30dBm
- Low noise and distortion
- Utilizes Automated Processes 2520 Op Amp

DATATRONIX INC

Equalizer MODEL 550A

- Low noise and distortion
- Panel mounting 1½" x 5½"
- Utilizes Automated Processes 2520 Op Amps

Description

The Automated Processes Model 550A Equalizer embodies improvements and changes to the well known Model 550. Further increasing its versatility, performance and reliability, Model 550A-1 offers reciprocal equalization at fifteen points in five steps of boost or attenuation to a maximum of 12dB at each point. Noise has been reduced to -50dB. The LED tally light has been changed to a light emitting diode reducing current requirements and providing almost unlimited indicator life.

The fifteen frequency points are divided into three overlapping ranges with the upper and lower ranges individually selectable as either peaking or shelving. This combination of possibilities makes the 550A-1 ideally suited for all types of music or voice enhancement and effects equalization. A band-pass filter (50 Hz to 15 kHz) may be inserted independent of all other selected equalization settings.

Ten controls are provided to accomplish the various functions. Three dual concentric rotary switches perform frequency selection and degree of equalization for three ranges; the inner knob selects the desired frequency and the outer knob selects the degree of boost or cut in steps of 2, 4, 6, 9 and 12 dB.

Two push buttons select either the bell-shaped peaking curves or shelving curves for the upper and lower frequency ranges. The five center frequencies in the mid-range are reciprocal bell-shaped peaking families. A switchable single switch is used to insert the band-pass filter in the circuit.

A push button throws the equalizer network in or out of the circuit while lighting a small LED tally light showing when equalization is active. The switch is silent permitting use of this function during programs.

In order to optimize signal to noise ratio over the widest possible range of operating conditions, two input/output connections are provided. The "High Level" connection is recommended for input levels between 0 dBm and +12 dBm and provides output capability to +30 dBm. The "Low Level" connection permits operation at levels between -15 dBm and 0 dBm without encountering the usual increase in relative noise level. The maximum output capability in this connection is equivalently reduced to +22 dBm.

The Model 550A Equalizer makes use of Automated Processes 2520 operational amplifiers and therefore exhibits the reliability, long life and uniformity which are characteristic of this device.

The Model 550A operates from a bipolar power supply of from ±15 to ±18 volts permitting latitude in system design and assurance of stability under normal operating conditions. It is reverse polarity protected and will withstand 150% transients reducing the likelihood of damage from power line surges and power supply malfunctions. Power decoupling is also provided to minimize signal coupling in the power supply lines.

Features

- Three range—fifteen frequency boost or attenuation in steps to 12 dB
- Shelving or peaking curves independently selectable for upper and lower ranges

MODEL 550A EQUALIZER SCHEMATIC

**A.P.I.525C Compressor-Limiter (1)**

Model 525
Compressor-Limiter

Compressor-Limiter

- Switchable Compression and Limiting functions
- Ceiling control for 20 dB of compression or limiting
- De-Ess (Anti Sibilant)
- Four selectable Release times
- Fast attack time
- Integral illuminated meter
- Threshold and Output level controls
- In-Out switch
- Two range, frequency dependent release time
- Transformer coupled output to +24 dBm
- Flat Frequency Response
- Low distortion, less than 0.5% 30 to 20,000 Hz
- Low noise
- Stereo Interconnect
- Utilizes Automated Processes 2520 Op Amps

The Automated Processes Model 525 Compressor-Limiter is ideal for the reduction of distortion due to overload or overmodulation of program peaks in recording or broadcast applications.

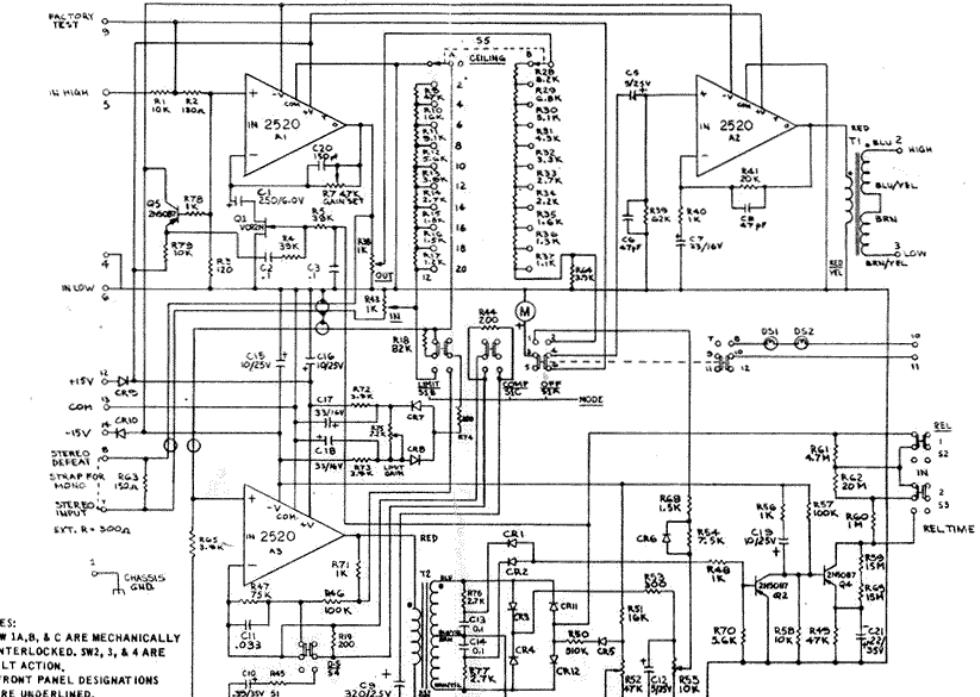

The Model 525 is designed for individual channel use, however its extreme flexibility, repeatable settings and stereo interconnect features make it ideal for all studio applications. Virtually any type of program material can be dynamically controlled by the 525 without annoying side effects through the use of its various features.

The unique Ceiling Control permits extreme ease of operation by providing up to 20 dB of compression or limiting in 2 dB steps while maintaining a constant peak output level.

Two small rotary controls set the initial operating parameters of threshold and output level. Full range of operation is achieved with signal input levels from -15 dBm to +20 dBm and output capability is +24 dBm through an integral coupled transformer. The four remote controls are push buttons that select the various methods of operation. One interlocked group of three buttons sets the basic mode of operation of the 525: Compression (C), Limiting (L), or as a unity gain

A.P.I.525C Compressor-Limiter (2)

MODEL 525C AUDIO COMPRESSOR-LIMITER

A.P.I.312 MIC PREAMP-1

Preamplifier**API MODEL 312****FEATURES**

- Transformer coupled input - 150 ohm and 600 ohm bridging
- Two transformer coupled outputs
- Gain externally adjustable (15 to 65 dB)
- Low noise and distortion
- High output (+30 dBm)
- Reverse polarity and overload protected
- Small interchangeable plug-in card
- Utilizes the Model 2520 Audio Operational Amplifier

GENERAL DESCRIPTION

The Model 312 is a plug-in PC card preamplifier having extremely low noise and distortion characteristics. Its power handling capability insures freedom from overload with today's high output microphones. Because of the high input acceptance level, the unit is also ideal as a line or booster amplifier. The Model 312 makes use of the 2520 Operational Amplifier as its active element and therefore exhibits the reliability, long life and uniformity which are characteristic of this device.

Gain of the Model 312 may be accurately adjusted through a 40 dB range to a maximum of 65 dB by the use of an appropriate fixed resistor on the external connector, or made variable within this range by the use of a potentiometer. By means of transformer connections, gain may be reduced to 15 dB. Optimum signal to noise ratio and low distortion characteristics are maintained independent

of gain settings within the ratings of the amplifier. Since all input and output impedance connections as well as gain selection are accomplished on an external connector, all Model 312 amplifiers in a system are completely interchangeable.

The output transformer of the Model 312 is of unique design and contains two independent secondary windings. The first winding, which is centertapped, provides greater than +26 dBm into 600 ohms. An output in excess of +22 dBm is simultaneously available from the second winding. Continuous undistorted power output capability of +30 dBm into 600 ohms is provided by strapping both secondary windings in series at the connector. The unit is short circuit protected and cannot be damaged by input or output overloads.

The Model 312 operates from a bipolar power supply of from ± 12 to ± 20 volts permitting great latitude in system design and assurance of stability under normal operating conditions. It is reverse polarity protected and will withstand transients as high as ± 30 volts preventing damage from power line surges and power supply malfunctions. Tightly regulated supplies are therefore not required. Power decoupling is also provided to prevent signal coupling in the power supply lines.

A convenient accessory, the Model 300-PR Powered Rack accommodates up to 10 amplifier cards in a 3 1/2" x 19" enclosure.

The Model 312 is supplied with mating connector and is equipped with a color coded card extractor handle.

Automated Processes, Inc.

A.P.I.312 MIC PREAMP-2

Specifications

(600 ohm load unless otherwise specified)

Applications: Microphone Preamplifier, Line Amplifier, Booster Amplifier

Gain: Externally adjustable on mating connector from 15 dB to 65 dB

Frequency Response: ± 0.5 dB, 30 Hz to 20 kHz at rated output

Noise: Equivalent to an input of -129 dBm, 20 Hz to 20 kHz unweighted

Distortion $\pm 16V$ Operation: 0.05% THD typical at $+18$ dBm output, 30 Hz to 20 kHz

Clipping Level (3% THD) $\pm 16V$ Operation: $+26$ dBm (output 1 into 600 ohms); $+30$ dBm (both outputs in series)

Input: Bridging transformer*

Source Impedance: 150 ohms or 600 ohms

Input Level: Signal amplitude as high as -3 dBm will produce no more than 0.5% THD, 30 Hz to 20 kHz, within the output ratings of the amplifier

Input Impedance: 1 K ohm, typical

Output: 2 secondary windings which may be used in series or as 2 separate outputs

Output Impedance: Less than 45 ohms (output 1); less than 15 ohms (output 2); less than 85 ohms (2 windings in series)

Overload Protection: Current limited; protected against overload or short circuit under any output or input condition

Overload Recovery: Instantaneous

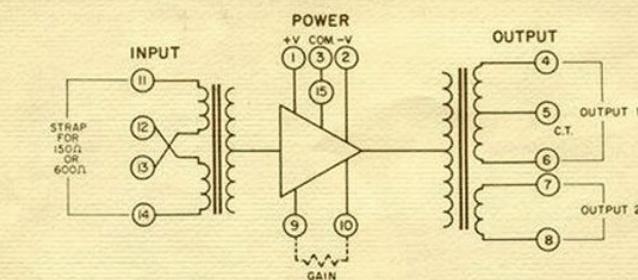

Power Requirements: $\pm 12V$ to $\pm 20V$ DC, Bipolar 20 mA at $+4$ dBm output 65 mA at $+30$ dBm output. Protected against polarity reversal.

Temperature of Environment: Up to 120°F without derating

Connector: Dual 15 pin connector supplied

Dimensions: 2-3/4" high, 4-1/4" deep, 1-7/16" wide

*Supplied standard with Jensen JE-6110K-APC transformer.

(Specifications may change as design improvements are introduced.)

MIC PREAMP SCHEMATIC

A.P.I.325 LINE AMP-1

**Line, Booster, or Combining Amplifier
MODEL 325**

Features

- Bridging or combining function input.
- Three transformer coupled outputs.
- Gain externally adjustable.
- Low noise and distortion.
- High output (+30 dBm).
- Reverse polarity and overload protected.
- Small interchangeable plug-in card
- Utilizes the Model 2520 Audio Operational Amplifier.

Description

The Model 325 is unique in its design as a bridging amplifier and a different active combining network with transformer coupled outputs.

All of the connections for the two modes of operation are accomplished at the external connecting socket. A companion terminal board containing a precision summing network is also available.

The Model 325 makes use of Automated Processes' 2520 operational amplifier as its active element and therefore exhibits the reliability, long life and uniformity which are characteristic of all automated products.

Gain of the Model 325 may be conveniently and accurately adjusted through a 40 dB range to a maximum of 49 dB by the use of an appropriate fixed resistor on the external connector, or made variable within this range by the use of a potentiometer. By means of transformer connections, gain may be reduced to unity. Optimum signal to noise ratio and low distortion characteristics are maintained independent of gain settings within the ratings of the amplifier. Since all mode of operation, choice of internal or external gain selection is accomplished on an external connector, all Model 325 amplifiers in a system are completely interchangeable.

The output transformer of the Model 325 is of unique design and contains three independent secondary windings. Each winding is capable of simultaneous outputs in excess of +20 dBm into 600 ohms. Continuous undistorted power output of +30 dBm into 600 ohms is available from each of the three secondary windings in series at the connector. The unit is short circuit proof and cannot be damaged by input overloads. The Model 425 companion Summing Network gives complete freedom of choice as to number of inputs to be summed up to 22, with gains set between unity and 20 dB.

The Model 325 operates from a bipolar power supply of from ± 12 to ± 20 volts, permitting great latitude in system design and assurance of stability under normal operating conditions.

It is reverse polarity protected and will withstand transients as high as ± 30 volts preventing damage from power line surges and power supply malfunctions. Tightly regulated supplies are therefore not required. Power decoupling is also provided to prevent signal coupling in the power supply lines.

Up to eleven amplifiers can be mounted in Model 411 Card Frame which is 9 $\frac{1}{2}$ " high, 6" deep and 10" wide. Five amplifiers can be mounted in Model 405 Card Frame which is 9 $\frac{1}{2}$ " high, 6" deep and 10" wide.

The Model 425 Summing Network mounts between adjacent amplifiers in either card frame and therefore does not require additional space.

The Model 325 is supplied with mating connector and is equipped with a color coded card extractor handle.
